

1. INTRODUCTION

PROBLEM

- Identify social media usage patterns.
- Analyze time spent on different social media platforms.
- Understand user engagement and activity.

APPROACH

- Collect social media usage data.
- Clean and organize the dataset.
- Perform descriptive and exploratory analysis.
- Visualize usage patterns.
- Interpret the findings.

WHY THIS STUDY?

- Understand user behaviour.
- Identify highly used platforms.
- Study relationships between usage variables.
- Support better understanding of digital habits.

2. DATASET

SOURCE:

Social Media Usage Dataset

TOTAL RESPONSES:

10,000 Customers

KEY VARIABLES COLLECTED

- User ID
- Age
- Gender
- Social Media Platform
- Daily Usage Time
- Number of Sessions
- Posts Per Day

- Comments Per Day
- Shares Per Day
- Most Used Platform
- Engagement Level
- Sleep Duration
- Usage Frequency
- Likes Per Day

DATA

- 10,000 Users**
- 14 Variables**
- Numerical & Categorical Data
- Usage and engagement information
- Demographic information

3. METHOD PIPELINE

DATA COLLECTION

DATA CLEANING

DESCRIPTIVE STATISTICS

EXPLORATORY DATA ANALYSIS

VISUALIZATION

INTERPRETATION

4. RESULTS

5. CONCLUSION

- Data cleaning improves the quality and reliability of social media data.
- Visualization makes usage patterns easier to understand.
- Different platforms show different levels of user engagement.
- Usage time and engagement can reveal meaningful behavioural patterns.

6. FUTURE DIRECTIONS

- Use larger social media datasets.
- Include more platforms.
- Analyze usage trends over time.
- Apply machine learning to predict user behaviour.
- Study the relationship between social media usage and productivity.

KEY INSIGHT

- 10,000 Users | 14 Variables**
- Data cleaning improves the accuracy of social media analysis.
- Daily usage time identifies user activity patterns.
- Popular platforms show higher user engagement.
- Visualization makes usage trends easier to understand.
